

The University administration needs a workshop management system to manage the events efficiently. The technical requirement committee decided to use Spring Boot and MySQL for the system development. The system has been divided into components and assigned to each 3rd year IT student.

You have been assigned to a task “Model Building”. The following requirements are given to create proper models and, migrate them to a database using proper ORM techniques.

*” The university is arranging many workshops for undergraduates and postgraduates. A workshop contains many presentation sessions done by experts in the field. A session can be presented by many experts. An expert can present for multiple sessions. Mostly, graduates participate in many sessions of the workshops. A sample data file is given to have more understanding of the attributes and data types.”*

After the migration, take a backup of the generated database and display the description of each table.
